

## WHAT IS ACRYLIC?

Let's start with acrylic paint since it is the most widely used acrylic medium. Acrylic paint is made up of polymer emulsion; being its binder, dry pigment, and chemicals that control the paint's stability, viscosity, and longevity.

Acrylic mediums have varying amounts of basically the same ingredients as acrylic paint (minus the pigment) that determines the structure and capabilities of each. Different brands of acrylic mediums are interchangeable, allowing for a wider range of outcomes, even though their chemical makeup may be altered by doing so.
